Ref : Research for an Internship

Dear Sir or Madam,

I am currently in the third year of a five-year course in IT engineering and seeking for a four months internship in this branch. With the present cover letter, I would like to show you the interest and motivation I have regarding your company.

I really think that this internship would help me to improve my skills in both English and IT. As far as I can remember, I have always wanted to be an IT engineer because it progresses so fast, each day new things are discovered improving people's life. I would like to be part of those persons who make people's life easier.

Throughout these three years, I learnt many methods regarding development, networking and system. But, obviously, there are still many things to learn and practicing is the best way to do it.

During my last internship in a French company specialized in automatism named NOREALP, I had to develop a C# application for one of their customers. Once the application was complete, I had to bring it into operation. I really enjoyed this work experience as my mentors trusted me throughout the making of a whole projetc ; from the beginning to the end . For the rest of my internship, I was asked to develop a storage management also in C# to inform the accounting department of the inputs and outputs of the equipment.

I would really like to join your company to acquire a new experience, I am sure you have much to offer me in terms of knowledge. I am available for an interview and would be glad to discuss with you.

Thank you very much for your time and consideration.

Kind regards,

Charles LELEUX
